

**Continue**

1 Open Start . Click the Windows logo in the bottom-left corner of the screen. 2 Type store into Start. This will search for the Windows Store app that's built into all Windows 10 computers. 3 Click {"smallUrl": "https://www.wikihow.com/images/c/ce/Microsoft\_Store\_app\_icon\_2022.png", "bigUrl": "https://thumb.c/ce/Microsoft\_Store\_app\_icon\_2022.png", "smallWidth": 460, "smallHeight": 460, "bigWidth": 30, "bigHeight": 30, "licensing": "New and improved Microsoft Store app iconLicense: Public Domain (ineligible for copyright protection)"} Store. It's at the top of the Start window. The Store window will open. 4 Click the search bar. It's in the top-right side of the Store window. 5 Type in qr code bar scanner. Doing so prompts a list of QR code scanners to appear in a drop-down menu below the search bar. 6 Click Qr Code Bar Scanner. It should be the top option in the drop-down menu. The app's page will open. 7 Click Get. This blue button is on the left side of the window. Clicking it will prompt the QR scanner to begin downloading onto your computer. 8 9 Point your computer's webcam at a QR code. The QR code should be positioned in the middle of the screen. 10 Wait for the QR code to scan. Once the QR code scans into the app, you'll see a pop-up window appear with the QR code's content listed in the middle of it. For example, if the QR code contains a link to a website, you'll see that link displayed in the pop-up window. You can click Other in the pop-up window and then click the globe-shaped icon in the bottom-right side of the subsequent window to open the QR code's content in a web browser. Advertisement In 2015 I had written an HTML5 based QR code scanning library as a jQuery extension. Recently I realised there was some consistent traffic on my Github Project and the demo page. As I dug more into what was going on and I was embarrassed to see the poor design and obsolete support to the latest HTML APIs around Camera. I recently fixed some of the issues and refactored the javascript library that is now independent of jQuery library and supports Promise based APIs. In this article I'll explain how to use the new version of the library, some changes and reasons for them and existing issues and plan to fix them.Important Edit 1 (14th June 2021)Update: Version 2.x.x can scan different types of codes including bar codes, aztec codes and different 1D codes along with QR Codes.Lot of things have changed since v1.0.1 and latest release for the library is v2.0.9 - Please visit QR and barcode scanner using HTML and Javascript for latest content.If you are interested in a web based QR Code or barcode scanner try out: scanapp.org (it's the perfect demo of this project).Continue reading article on v1.0.1To callout loud, the major changes are:Removed jQuery dependencyRefactored the APIs to return Promise rather than being purely based on callbacks.A sample QR Code, try scanning itRead full article with code examples at Code is a very common technique of encoding information as images. Its a very common used in physical stores for identifying products like bar code is used.Scanning on Android platform from webThe javascript library available at mebjas/html5-qrcode on Github allows users to add a QR code scanner in their web applications. It works cross-platform and across different devices like PC, Mac or smartphones. It uses the stream from the camera and try to decode frames at a certain frequency (configurable) and notify the caller about results via callbacks. Requesting camera permissions in browsers usually results in a permission dialog popup to users for requesting permissions and can only be used if the user grants them.Figure: Sample permission flow triggered by Chrome browser on MacUpdate: Html5QrcodeScanner, an end to end QR Code Scanner — version 1.1.5Recently introduced an end to end Qr code scanner on top of the library presented in this article. You can use Html5QrcodeScanner class to integrate scanning with 5 lines of code — read more. If you are interested in integrating the library with your own user interface, continue with this article.DemoA demo for this project is hosted at to useDownload the Javascript code or use the Github versionThe code is hosted at mebjas/html5-qrcode on Github. You can download the library and add it to your codebase from release page or use it directly like:I highly recommend using the minified version for the following reasons:It's smaller in size and would load faster.The actual code html5-qrcode.js is written using ECMAScript which is supported only in the latest browsers. It may not be supported in older browsers. The minified script has been transpiled using Babel.Not recommended If you still wish to use the non-minified library, try including these:Add a placeholder element in HTMLAdd an empty HTML element at the appropriate position in your HTML code, give it an id. The library uses this element to insert some hidden HTML elements which shows up as a viewfinder (camera input is shown in this HTML element) to the user performing QR code scan.Enumerate all available camerasThe Html5Qrcode exposes a static method to enumerate all supported cameras in the device. Calling this method would trigger user permissions as these permissions are required to get the name of the cameras in certain browsers. This method returns a Promise with a list of supported cameras.The returned object is an Array of Object with the following fields:id: Id of the camera. This is needed to start scanning the QR Code.label: Label for the camera. This is human-readable name for the camera device like Front Camera or Back Camera.Once you have cameraId you can perform start/stop operationsStarting the camera implicitly starts QR Code scanning. It runs at a certain fps (frame per seconds) provided in configuration argument. This is an optional field and by default the scanner runs at 2 fps.To start scanning you need to create an instance of Html5Qrcode and call start() API. This method returns a Promise which succeeds when QR Code scanning starts: Real-time feed starts to show up and QR code scanning starts. When the code is detected the callback qrCodeSuccessCallback is called and when it's not detected, the qrCodeErrorCallback is called.The configuration argument in start() method can effect both scanning behavior and UI. There are two optional properties right now, if you don't want them you can just pass an empty Object like {} .fps - Integer, Example = 10Also known as frame per seconds, the default value for this is 2 but it can be increased to get faster scanning. Increasing to a very high value could affect performance. Value >1000 will simply fail. Ideal value for this could be 10.qbbox - Integer, Example = 250Use this property to limit the region of the viewfinder you want to use for scanning. The rest of the viewfinder would be shaded and ignored by the QR code scanner. For example by passing config { bbox : 250 }, the screen will look like:This is an optional property, if nothing is passed, the scanner will scan the entire region of the viewfinder.To stop scanning, use stop() methodThe stop() member method in Html5Qrcode returns a Promise which finishes when the video feed is closed and held resources are released.This should only be called after QR Code has been started successfully.For more clarity I have dumped the javascript code used in demo in this public gist.This code uses jQuery but it's not really needed.Changelog in v1.0.0Removed jQuery dependencyRefactored the library to Promise based APIs.Refactored the code to ECMAScriptMerged Babel transpiled minified library with jsqr code to a single 52Kb library.Checkout my original article for more information — blog.minhazav.devExisting issues and plan to fix themIn milestone/v1.0.1 I plan to fix compatibility issues with Opera browser and IOS based browsers.Some open issues are:issue/14 — Fix camera query issue in IOS browsers — Chrome, Mozilla, Edge, Opera.[FIXED] issue/14 — Fix stuck camera issues in IOS Safariissue/13 — Fix camera query issue in Android Opera Miniissue/16 — Fix Camera Query issue in Mac OS Opera browserHow to contributeIf you are excited or interested you can contribute to this project by:If you find compatibility issues with certain browser, create an issue here.Raising issues for bugs faced, at Github issue page for the project. Feel free to add some related interesting discussions which could be taken up as work-item.Sending a Pull Request for bugs fixed by you.Rating the project with stars and shares.Read full article to this article18th April 2020 - Added support for local file scanning and using default camera on smartphonesReferences Ermöglicht einen QR Code für die aktuelle Seite zu erzeugen und QR Codes mit der Webcam zu scannen.Generiert einen QR-Code von der URL des aktuellen Tabs mit einem einzigen Mausklick. Der QR-Code wird inline in einem kleinen Popup-Fenster angezeigt. Bitte beachten Sie, dass diese Erweiterung, im Gegensatz zu anderen Erweiterungen, keine besonderen Berechtigungen benötigt (wie den Zugriff auf Ihre Tabs und Daten). Es wird nur geladen, wenn Sie auf den Button klicken. Sie verbraucht also keinen Speicher oder hat auswirkungen auf die Leistung, während sie nicht verwendet wird. Beachten Sie auch, dass der QR-Code ist komplett offline erzeugt wird. Die URL der Seite wird nicht über das Netzwerk gesendet (außer, wenn Sie auf "Bearbeiten QR Code" klicken - was www.the-qrcode-generator.com öffnet). Die Erweiterung ist also vermutlich so gut es geht, was Datenschutz und Sicherheit angeht.
